and extremities certified.

Muneharu Satsuma

Revolutionary Jaw & Facial Alignment Specialist about Dr.Satsuma

Licensed Judo Therapist / Doctor of Dental Surgery (DDS) /Director General,
Satsuma Biological Functional Beauty

(3 locations)Owner, Shibuya TMJ Dental Clinic, Tokyo

Breakthrough Innovation

Dr. Satsuma uniquely fuses traditional Japanese judo therapy with cutting-edge dental orthodontics, creating Craniofacial Skeletal Correction—a revolutionary approach focusing on the critical connection between jaw alignment and dental health. At age 43, he entered dental school to fully master this jaw-dental relationship, making him uniquely qualified for complex cases.

The Satsuma Method®

Dr. Satsuma has developed two signature techniques: The Satsuma Method®, a comprehensive system emphasizing prevention of postural distortions, and the Mewing Technique, an advanced tongue posture therapy for optimal facial development. These evidence-based approaches address root causes rather than just symptoms.

Proven Results

With over 23 years of practice in Tokyo's Shibuya district and more than 400,000 successful cases, Dr. Satsuma's evidence-based methodology successfully treats facial, jaw, and postural issues that traditional medicine often can't resolve. His exceptional skill has earned the trust of national celebrities, cultural icons, and world-class athletes.

Recognition

Dr. Satsuma's groundbreaking work has been featured on Nippon TV's "The Most Useful School in the World!" and numerous other health programs. He is also the published author of "90-Second Jaw Muscle Release" (Sekai Bunka-sha), sharing his expertise with a broader audience.

Before After

Sessions : First facial contouring session to realign

chief complaint : Jaw clenching, Masseter hypertrophy

postoperativ : Noticeably slimmer jawline and a more defined facial contour — even the eyes appeared more open and lifted. The head and neck alignment also shifted closer to its ideal position.

Sessions : First facial contouring session to realign + pelvic correction

chief complaint : Face line , asymmetry

postoperativ : Mouth opening is functionally improving, and we have been relieving the tension in the masticatory and facial muscles to enhance the facial contours. There has also been noticeable improvement in eyelid opening, with visible changes even in the size of the eyes.

Sessions : First facial contouring session to realign

Chief complaint : Long facial structure, asymmetry in the jawline and corners of the mouth, and jaw clenching (bruxism)

postoperative : The left masseter was released, and depth was added to the right cheek to balance the facial contour. Facial muscle mobility was improved to facilitate elevation of the mouth corners. Mandibular traction was applied to induce posterior rotation of the mandible, helping to reduce the elongated facial appearance.
